CtrlFleet Sets a New Standard in Transport Management

CtrlFleet, the next-generation transport management system (TMS), is reshaping how fleet operators approach scheduling, compliance, and visibility. CtrlFleet isn't just another tech solution, it's a smarter way to control.

Born out of industry frustration with disconnected tools and manual workarounds, CtrlFleet was designed from the ground up to unify every moving part of transport operations, from dispatch and driver communication to client updates and compliance tracking.

"*Most systems promise visibility. We deliver it, with planning, scheduling, tracking, risk control, and communication, all in one place,*" says CtrlFleet co-founder Renko Bergh.

The platform connects dispatchers, planners, drivers, and clients through a single, real-time system. Whether via cloud-based dashboards or the CtrlFleet Driver App, teams gain a live view of operations, enabling faster decisions and better service delivery.

Key features include:

- Real-time tracking integration, drag-and-drop scheduling
- Web-based links for client and subcontractor portals for ETA and order updates
- A powerful Driver App for instant instructions and custom form completion
- Reporting based on key business indicators like CPK and planned vs actual routing

Already trusted by major fleets across South Africa, CtrlFleet is helping logistics teams move from reactive problem-solving to proactive control, cutting admin, boosting uptime, and strengthening performance.
